

This is a test document demonstrating abbreviation styles provided by the `glossaries-extra` package. Hyperlinks are shown in [magenta](#).

Some of the styles just use the default formatting commands (which don't change the font). To make the default setting clearer, this document has done:

```
\renewcommand{\glslongdefaultfont}[1]{\textsf{#1}}
\renewcommand{\glsabbrvdefaultfont}[1]{\textsf{#1}}
```

So any text in this document that's rendered in sans-serif would normally not have any font change implemented.

There are additional font changing tests implemented with outer text formatting (the `textformat` key) and inner text formatting (the `innertextformat` key).

The hyperlink may be placed outside the outer formatting (`hyperoutside=true`) or inside of the outer formatting (`hyperoutside=false`). Note that when the hyperlink is outside, the text colour change applied by the sample formatting command (teal) overrides the colour change applied by the hyperlink colour setting (magenta). The outer text format can also be changed globally by redefining `\glsformat` or via the `textformat` attribute. (Order of precedence: `textformat` option, `textformat` attribute, `\glsformat`.)

The inner formatting is implemented within the abbreviation style, so it won't show up in custom styles that don't implement it. The outer formatting isn't applied to the post-link hook. The inner formatting may be applied to the post-link hook, depending whether or not it's supported by the abbreviation style.

The outer text format is tested with the custom command defined as:

```
\newcommand*{\sampleformat}[1]{\textbf{\color{teal}#1}}
```

The inner text format is tested with `\hl` provided by `soul.sty`. (Complex commands such as those provided by `soul` can only be used in the inner text format. The outer format has the text content too deeply embedded for those commands to process.)

Each test entry is defined using

```
\newabbreviation[category=#1,user1={user text}]%
{sample-#1}{short}{long form}%
```

for the non-desc styles or

```
\newabbreviation[category=#1,user1={user text},%
description={sample description}]%
{sample-#1}{short}{long form}%
```

for the `-desc` styles (where `#1` is the style label). Note that many of the entries will have duplicate sort values, so don't build this with `xindy`. You can change the ordering in the glossary to that it's sorted according to the style name by changing the above definitions to:

```
\newabbreviation[category=#1,user1={user text},sort={#1}]%
{sample-#1}{short}{long form}%
\newabbreviation[category=#1,user1={user text},sort={#1},%
description={sample description}]%
{sample-#1}{short}{long form}%
```

To assist with distinguishing between the various styles, the post-description hook (used after displaying the description in the glossary) is set to `□[style:□#1]` for all categories, and the footnote command `\glsxtrabbrvfootnote` has been redefined to include the short form hyperlinked to the glossary.

The test entries that use the `-hyphen` styles have had the `markwords` attribute set. This is designed to trigger compound word hyphenation if the inserted text (through the final optional argument of `\gls`) starts with a hyphen.

The symbol  indicates that a warning would normally be issued at that point in the document for a style that's too complex to support the given command.

## Chapter 3

# First Use With Insert

First use of `\gls{label}[-insert]`. The conditional `\ifglstrinsertinside` is used by some styles to determine whether or not to include the inserted material inside the font changing command used by the style. The default is: false.

In this test chapter, each entry is reset, then displayed with

```
\glstrinsertinsidefalse
```

then reset and displayed with

```
\glstrinsertinsidetrue
```

(following the semi-colon). Some styles may only obey this conditional for particular commands. (For example, the inline commands like `\glstrfull` may behave differently to commands like `\gls`.)

Some of the styles just use the default font commands (which don't change the font) so there's no noticeable difference. To make the differences more noticeable this document has done:

```
\renewcommand{\glslongdefaultfont}[1]{\textsf{#1}}
\renewcommand{\glsabbrvdefaultfont}[1]{\textsf{#1}}
```

## Chapter 4

# Next Use With Insert

Next use of `\gls{label}[-insert]`.

In this test chapter, each entry is displayed with `\glsxtrinsertinsidefalse` and then displayed with `\glsxtrinsertinsidetrue` (following the semi-colon). Some styles don't check this conditional.

## Chapter 8

# Full Form With Insert

Full form using `\glxtrfull{label}[-insert]` (inline full style). In this test chapter, each entry is displayed with `\glxtrininsertinsidefalse` and then displayed with `\glxtrininsertinsidetrue` (following the semi-colon).

## Chapter 9

# Short Form With Insert

Short form using `\glxtrshort{label}[-insert]`.

In this test chapter, each entry is displayed with `\glxtrininsertinsidefalse` and then displayed with `\glxtrininsertinsidetrue` (following the semi-colon).

## Chapter 10

# Long Form With Insert

Long form using `\glxtrlong{label}[-insert]`. Note that the hyphen styles with the `keywords` attribute don't adjust in this case.

In this test chapter, each entry is displayed with `\glxtrininsertinsidefalse` and then displayed with `\glxtrininsertinsidetrue` (following the semi-colon).

# Chapter 11

## First Form

First form using `\glsfirst`. This may be different from the first use of `\gls` depending on the style. In general, it's better not to use `\glsfirst` with abbreviations. Use `\gls` (possibly with a reset) or `\glsxtrfull` instead. Some styles are too complicated to work with `\glsfirst`.

# Chapter 12

## Text Form

Text form using `\glstext`. This may be different from the subsequent use of `\gls` depending on the style. In general, it's better not to use `\glstext` with abbreviations. Use `\gls` (possibly with an `unset`) or `\glstrshort` instead.

## Chapter 13

# First Form With Insert

First form using `\glsfirst{label}[-insert]`. This is different from the first use of `\gls` as can be seen by the location of the inserted material. (There's no check for the conditional `\ifglsextrinsertinside`.) In general it's best not to use `\glsfirst` with abbreviations. Use either `\gls` (possibly with a reset) or `\glsextrfull`.

## Chapter 14

# Text Form With Insert

Text form using `\glstext{label}[-insert]`. This doesn't check for the conditional `\ifglxtrinsertinside`. In general, it's better not to use `\glstext` with abbreviations. Use `\gls` (possibly with an `unset`) or `\glxtrshort` instead.
